Pilings Anchoring

Pilings Anchoring System by Kroeger Marine

5" diameter schedule 40 pipe driven into the lakebed. They are ideal for heavy load docks and perfect for locations with heavy wind and wave load. This anchoring system offers the benefit of extra reliability for securing the dock, also while allowing more functionality and being the better aesthetic option by eliminating cables to shore. The dock structure has built-in aluminum hoops that allow the dock to move toward or away from the shore during water fluctuations.

Key Features:

- 1 24' aluminum pipes driven 8' to 10' into the lakebed, providing much more stability.
- 2 Eliminates the need to have dock cables to the shore which can be a navigational hazard.
- 3 Allows the dock to move up and down as the water level fluctuates and requires no management to do this.
- 4 Provides a more aesthetically pleasing overall look.
- 5 Eliminates side to side stress that traditional cable to winch anchoring cannot provide.
- 6 Piling hoops are available in a variety of finish options, from our classic finish to our signature, Zuri-wrapped finish.
